

Sample Paper 11**Score for Voice** _____**The Amazing Polar Bear**

The amazing polar bear—also known as the sea bear or ice bear—is a threatened species. This is mainly because of humans. It is very sad. Humans hunt polars. It is dangerous to eat polar bear liver. (You might not anyway because, well, it's liver.) The liver of a polar bear has so much vitamin A that it can be toxic. Global climate change is another problem affecting the amazing polar bear. Global warming makes it hard for the amazing bears to survive.

Here are some interesting facts about the life cycle of the polar bear. Like many animals, female polar bears are very protective of their young, and not just around humans. Male polar bears have been known to kill young bears. These amazing bears don't really have natural enemies, except for humans. They don't really fear people, which can be a big problem. They live mostly in the Arctic. They hunt seals. They only use their front legs to swim! They are extremely big and they have amazingly sharp claws, but not much of a tail. Their fur and skin work together in an amazing way to help keep the polar bear warm.

Everyone should work together to keep the amazing polar bears from disappearing. A world without polar bears is a world that we definitely do not want to have as our world.
