

Sample Paper 19**Score for Sentence Fluency _____****Mosquitoes, Beware!**

A new kind of mosquito repellent is being developed. It's being developed by scientists right now. This is really good news for campers. This is good news for ALL outdoor people! This new repellent is made from tomatoes. It is hard to believe, but it is true. It's made from tomatoes. Yes! This is true! Scientists found out that mosquitoes hate tomatoes. There's this natural compound in tomatoes. This natural compound actually protects them from insects. Scientists used this natural compound to make a mosquito repellent.

The new repellent really works. It really does! It works even better than you might think! It repels more than mosquitoes. It repels ticks, ants, biting flies, fleas, cockroaches, and aphids, too. The good news for people is that it is safe. The tomato repellent is safer than mosquito repellents made from other chemicals. The tomato repellent has no bad side effects. The chemical repellents, moreover, can have many side effects. Chemical repellents can cause skin rashes, swelling, itching, and other irritations. Just to name a few. The tomato repellent doesn't cause any of these things. It just keeps mosquitoes away.

Mosquitoes are terrible pests that carry diseases. If we have a harmless way to get rid of mosquitoes, we should use it. If this kind of tomato repellent works, maybe scientists will develop other products that use tomatoes. If you are thinking you will just rub tomatoes on your skin, forget it. It won't work. It won't hurt you, but it won't work. It could save you money, of course! (It won't work, though, seriously.) Mosquitoes, beware!
